W. ATLEE BURPEE
founder of Burpee's seeds

Dear Fellow Gardener

More than 80 years in the seed business has given us a wealth of experience. We have learned how to grow better seeds for your garden. In recent years we have been using new methods of plant breeding and the results are truly amazing.

The new and improved varieties of flowers and vegetables offered in this Burpee catalog are far better than the ones we sold 80 years ago. We are the American pioneers in creating and selling the first hybrid vegetable seeds such as tomatoes, cucumbers, Zucchini squash, eggplants and cantaloupes, and new flowers such as the Red and Gold Hybrid Marigolds, which are not only hybrids but first generation species hybrids.

The vegetables we consider to be the very best in each class are marked in this catalog by a Bull's Eye . Flowers are not so marked because your selection of them depends so much upon your own preference for colors.

In both flowers and vegetables we offer only the varieties we consider well worth growing in your garden. No matter how well you like the old favorites you will find it very interesting and rewarding to grow some of the new varieties offered in this catalog which cannot be purchased elsewhere.

For many years we have advertised: "Burpee Seeds Grow, and are the best that Grow." Luther Burbank wrote me: "I consider your house the most reliable retail house in the world and I think that would be the verdict of the public at large."

We endeavor always to merit that reputation.

Faithfully yours,

Burpee's *Floradale Farms* IN CALIFORNIA

Sweet Peas have been a Burpee specialty for many years. Shown above is a harvest of sweet peas being threshed and bagged at Floradale prior to processing to clean and refine the seed. Burpee's Sweet Peas are offered on pages 11, 12 and 13.

Cultivating a field of beans. Later the entire field will be "rogued"—removal by hand of all plants not meeting standards. This is costly, but assures top quality seeds.

Acres of petunias growing for seed is a glamorous scene at Floradale. Many improved new petunias, including gorgeous new first generation (F₁) hybrids, are listed on pages 2 and 3.

Below is an experimental block of petunias with best specimens selected for development. They are caged against insect pollination.

David Burpee, President of W. Atlee Burpee Co., takes notes among new selections for 1957 of Nearest-To-White Marigolds. His \$10,000 offer for a pure white marigold is on page 18.

Burpee's *Fordhook Farms* IN PENNSYLVANIA

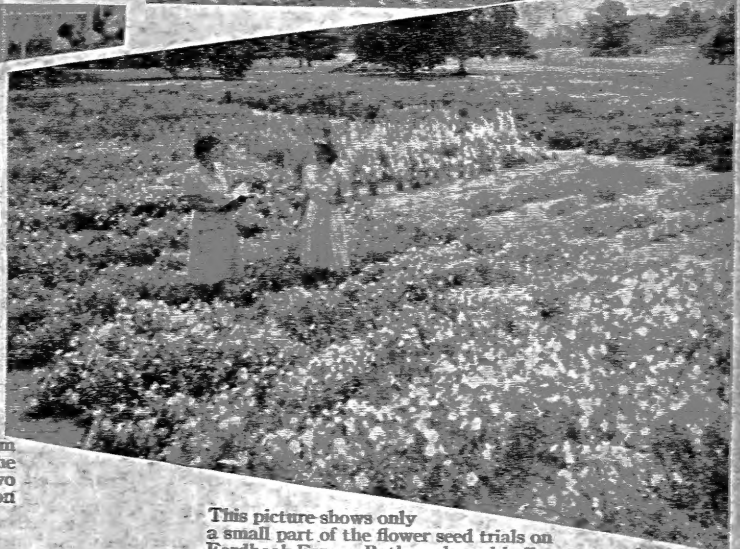

College girls hand pollinating tomato blossoms to create Burpee's famous hybrid tomato seed which is offered on pages 105 to 107.

Below is a section of the bush bean trials at Fordhook. Seeds are tested here to assure purity, quality and productiveness.

In the greenhouse at Fordhook, botany students from several colleges pollinate perennials by hand to create the lovely Burpee R. alldouble and R. single hybrids. Two new alldoubles, a salmon and a white, are introduced on page 33; new singles on page 34.

This picture shows only a small part of the flower seed trials on Fordhook Farms. Both seeds and bulbs are tested at Fordhook to insure that Burpee customers get the best that grow. Additional acres are devoted to vegetable trials, breeding and experimental plantings. Many of the world's most famous flowers and vegetables, like Fordhook Lima Beans, have been named for Fordhook Farms—the most famous seed farms in the world.

Workers remove male blossoms from cucumber plants, part of the costly process in producing seed for the famous Burpee Hybrid Cucumber. Thousands of gardeners have written us about the amazing quality and productiveness of this cucumber listed on page 85.

Noting beet trials. Comprehensive data are taken at each stage of growth on all vegetables so the very best strains can be selected for seed production.

BURPEEANA Extra Early Asters

Burpeeana Asters are of uniformly upright, compact habit of growth and come into bloom extremely early. Flowers are globular, double, 3 to 4 in. across, with attractively incurved petals. They are highly prized in the garden and for cutting.

Plants are of erect, base branching growth, average 20 in. in height, with many stems per plant, each stem topped with a flower somewhat resembling the American Beauty in shape. Terminal flowers come into bloom at about the same time, thus making a grand showing. In our plantings, Burpeeana Asters reached the peak of their bloom two weeks or more earlier than Queen of the Market, with larger and better shaped flowers and longer, stronger stems.

HOW TO GROW ASTERS

Asters are easy to grow. They prefer rich, well-drained soil and a warm, sunny location. For earliest blooms, sow seed indoors in boxes or seed-pans four to six weeks before your usual outdoor planting time. Set plants in the garden when weather gets warm. A continuous display of flowers from early summer until frost can be had by planting Extra Early Burpeeana and other early, midseason and later blooming varieties. Asters have long lasting qualities, so are wonderful for cutting.

The vigorous, bushy, pyramidal shaped plants are very free blooming from midseason until frost. Flowers are lovely for cutting and make a bright display in the garden. Giants Pansies Pkt. 75¢

HOW TO GROW PANSIES

Pansies always have been a great specialty with us and we are justly proud of our strains. Their wide range of colors, markings and forms, their easy culture, have made Burpee pansies universally popular. Pansies succeed best in fairly rich, well-drained soil in a sunny position, and produce their finest flowers in the cool, early days of spring. Keep flowers picked during the summer, plants pinched back to produce new growth and flowers in early fall. Seeds may be sown outdoors when soil has become warm; for earlier blooms, start seed indoors or in a warm hotbed four to six weeks before your usual outdoor planting time.

MULTIFLORA SWEET PEAS

Flowers are of medium size, stems are long and strong. The number of blooms to a stem seems to vary with the color—five, six and more under favorable conditions. Many of the flowers are strikingly waved. In color they range from pure white through shades of pink and rose, orange-cerise, lavender, etc. Plants are vigorous, free blooming, rather early; flowers are wonderful for cutting.

SNAPDRAGONS

These exquisite flowers have always been universal favorites for color in the garden, in the greenhouse during the winter, and as cut flowers. Of easiest culture, succeeding best in rich or moderately rich soil—in full sun or semi-shade. The gorgeous flowers are freely produced for several months, and until frost where conditions are favorable. Sow seeds outdoors when soil has become quite warm; for earlier blooms sow the seed indoors six weeks before your regular outdoor planting time, and transplant the seedlings in the garden when the soil has become warm.

Burpee's Tetra Snaps

Giant Ruffled Tetraploid Snapdragons

ALL ORIGINATED ON BURPEE'S FLORADALE FARMS

Tetra snaps are a Burpee scientific creation, originated through the treatment of the best regular or diploid varieties with colchicine—a drug or chemical derived from the bulbs of fall crocus. Genetically, they are known as tetraploids, for, when examined under the microscope, they have twice the number of chromosomes in their cells as the regular or diploid snapdragons.

Burpee's Giant Tetra Snapdragons are extremely large and attractively ruffled. Plants are exceptionally strong and husky, with glossy, dark green foliage, thick and almost leathery in texture; the stems are quite heavy. Under general field conditions the central spikes grow 2 ft. and more in height; these are surrounded by lateral spikes of lesser height. Plants are base branching so that long-stemmed flowers are assured for cutting; having good substance adds to their keeping value. Wherever seen, they are sure to demand admiration.

3495 Tetra Candlelight Clear, bright yellow, nicely formed, well placed flowers are freely borne on strong, erect spikes. Extremely rich and beautiful.

4267 Tetra Crimson Very large, deep but bright, velvety crimson flowers closely set on long, broad, tapering spikes above dark green, thick foliage.

3499 Tetra Shades of Rose Especially selected for those who prefer the clearer, deeper shades of rose for their garden. A most appealing blend.

3493 Tetra Sunset Hybrids Pleasing color blend of bronze and soft shades of pink. Much admired. Pretty in beds and borders or when cut.

4364 New Selections for 1957 of Nearest-to-White Marigolds Pkt. 25¢

\$10,000 for a White Marigold

Burpee will pay you \$10,000 if you are the first person who sends us seeds that grow the first White Marigold as big as Man-in-the-Moon Marigold, and as white as Snowstorm Petunia. It must be understood that you will not give or sell White Marigold seeds to anyone else, and that all seeds sent to us become the property of W. Atlee Burpee Co., with the exclusive rights to name, introduce and sell, and no seeds can be returned.

In recent years we have made so much headway in getting marigolds nearer and nearer to white that we are confident a white marigold will appear soon—perhaps, as a mutation, in your garden this summer. If you find one, do not cut the flowers but let them go to seed and send about 100 seeds to us at Philadelphia 32, Pa., Clinton, Iowa, or Riverside, California. We will plant the marigold seeds on our Floradale Farms and the results will be judged by the President of the W. Atlee Burpee Co. and two other distinguished horticulturists. The decision of the majority of the judges will be final, and the results will be announced in our seed catalogs.

In this world-wide search for a pure white marigold, anyone, anywhere, may submit seeds except Burpee employees or their families. It is understood that all seeds submitted for trial are accepted by us only under the above conditions.

Judging "White Marigold" Trials at Floradale Farms on August 20, 1956. Dr. Stanley Wadsworth, Associate Professor of Horticulture, Oregon State College, Fleeta Brownell Woodroffe, Garden Editor, Better Homes & Gardens Magazine, and David Burpee, President of W. Atlee Burpee Co.

The White Marigold Treasure Hunt Continues

4154 Burpee's Red and Gold Hybrid Marigolds

DOUBLE SPECIES HYBRIDS BETWEEN AFRICAN AND FRENCH MARIGOLDS

Award of Merit, Royal Horticultural Society of Great Britain. Flowers of Burpee's Red and Gold Hybrids are exceedingly double, 2½ to 3 in. across, some are solid red while others are delightful combinations of red and gold. Color varies with the season—at times it becomes almost pure golden yellow and at other times a bright, rich mahogany-scarlet. The bushy, upright plants grow up to 2½ ft. tall, 2 ft. wide. They flower in 8 weeks from seed and continue to bear profusely and continuously until the plants are killed by frost. Especially suited for borders and beds; prized for cut flowers and exhibition. Good keepers; last a long time when cut.

Burpee's Red and Gold Marigolds are hybrids between the African and French Marigolds and for this reason a few African Marigolds of an orange color may appear in any planting. These African Marigolds can be distinguished from the hybrids before the plants are ¼ in. high by the green color of their stems; the hybrids have red stems. If any plants with green stems appear in your planting, we suggest that you transplant them to a separate location. They usually grow taller than the hybrids, more bushy and with larger flowers.

Burpee's Giant Hybrid Zinnias

First named and introduced by Burpee in 1951

The loveliest flowers ever created. They include first and second generation hybrids, grow 5 in. and more across, with a pleasing variation in petal formation, many being of the informal ruffled type, some attractively curled, others gracefully quilled. The loosely arranged petals give the flowers an airy appearance, free of the stiffness of other zinnia types.

Plants are strong, free blooming, 2 1/2 to 3 ft. tall and ideal for garden decoration and cutting. In our opinion these beautiful flowers have been wrongly named "Cactus Flowered" or "Giant Fantasy." No matter what name you prefer, be sure to get your seed direct from the originator.

Gloriosa Daisies are a tribute to the late Dr. Albert F. Blakeslee, who about 40 years ago, began selecting and hybridizing the best native Rudbeckias to produce larger flowers, better colorings, longer and more petals. When of maximum size as diploids he made tetraploids of them to further increase their size.

EVERLASTINGS AND STRAWFLOWERS

With the exception of Job's Tears, *Briza maxima* and *Honesty*, the varieties listed on this page are desirable for use as fresh cut flowers, and largely grown to dry for winter bouquets. Job's Tears is an annual grass grown for its grayish white seeds which are strung as beads. *Briza maxima* holds its panicles when dried and may be used alone or with dried flowers. *Honesty* is prized for its satiny, parchment-like partitions of the dried seed pods. The best method to dry the flowers and *Briza maxima* grass is to cut the material before it is fully developed, remove foliage, bunch loosely, and hang head downward in a cool, airy, shady place. The flowers of *Celosia* (Cockscomb), page 38, also last a long time if dried as you would everlastings. Flowers should be fresh and free from water. Dry them slowly and never over artificial heat.

NASTURTIIUMS

Ever popular plants of the easiest culture, blooming most profusely in ordinary, well-drained garden soil; if overly rich it will cause plants to produce more leaves than flowers. They are most useful plants for dry, sandy, or gravelly locations. Nasturtiums may be had in a great variety of shades and color combinations, single or double flowers and semi-tall or dwarf growing. Their varied colors, different shapes and refreshing fragrance make them most desirable for cutting.

SCARLET SAGE or SALVIA

Scarlet Sage is one of the most brilliant bedding plants, blooms from early summer until frost. Popular for beds, borders, edgings and pot culture; may be used for cutting. There are tall and dwarf varieties for different purposes. All are best treated as annuals but seed must be started early indoors in boxes of light, rich soil so as to have plants large enough to set in the ground outdoors when weather and soil have become thoroughly warm. Blue salvias are distinct from the scarlet being less showy but fine for planting in borders and to mix with other cut flowers.

For best results, sow seed indoors in shallow boxes or seed-pans 6 to 8 weeks before your usual outdoor planting time. Keep in a temperature of 65° F. or less from the time the seed is sown until the plants have made 8 leaves so that they will form buds. When plants are large enough to handle, pot them up singly and transplant to the garden when weather gets warm. Our strains produce a high percentage of exquisite, large, well-rounded double flowers.

Perennial flowers are the hardy, permanent ones that live for years. Plants grow to the flowering stage each year and die down again to the roots, which remain alive but dormant until the next season. Some perennials will flower the first year from seed if it is sown early, although two seasons are usually required before the plants produce their blooms. Sow seeds early so that you will have stronger plants to go through the winter and give more bloom the next spring and summer.

Cultural directions are given on every bag. With the perennials we have included the best of the biennials, seed of which is sown one year, the plants blooming the second season, after which they die.

HARDY GARDEN CARNATIONS

Who does not love the delightful, spicy fragrance of carnations? They are ideal for cutting and excellent for beds, borders, wide edgings, rock gardens or pots. All do best in well-drained soil, rich in lime, and a sunny exposure. If seed is sown early, many plants will bloom the same season. It is advisable to cut off all flowering stalks soon after blooming to prevent plants from becoming straggly. Plants, especially Chabaud's Giant Improved and Burpee's Super Giants, may be lifted in the fall, cut back and potted up for indoor winter flowering where light and heat conditions are satisfactory for their culture.

Chabaud's Giant

Clove-scented, deeply fringed, large, double blooms, 2 in. and more across, may be had in 5 or 6 months from the time the seed is sown. Profuse bloomers. 1½ to 2 ft. tall.

BURPEE'S Famous Vegetable Seeds

GROW YOUR OWN VEGETABLES

The vegetables you grow, if used when they are in prime condition, will be fresher, taste better and contain more vitamins and minerals than those usually bought at the store. To enjoy the flavor of vegetables at their very best, they should be cooked as soon as possible after being picked. Many of the best vegetables were first introduced by Burpee.

Follow the Bull's Eye ☉

We have used this mark, ☉, for years to guide the gardener in the selection of vegetable varieties which we believe will give the best results under varied conditions of soil and climate. We have reprinted an old woodcut which appeared in early Burpee Seed catalogs, the forerunner of our present symbol. This mark, ☉, usually called a bull's eye, was used by the ancient alchemists to represent gold. It therefore is most appropriate for indicating the varieties which we consider the best of their class. If you are not thoroughly posted which varieties to choose as the most suitable for your particular section, we suggest that you make your selection from those marked with the bull's eye.

Maturity Dates

The average number of days required from the time the seed is sown until vegetables are ready for use is given with each variety. Where plants must first be grown, such as Celery, Cabbage, Peppers, Tomatoes, etc., the number of days to maturity is from the time plants are set in the garden. Of course, the time is average, having been obtained over a period of years in our trial grounds under different conditions; some variation is to be expected, depending on the season, locality and time of sowing. The approximate maturity dates given will show the relative time when different varieties will be ready to use.

How to Grow Pole Beans

Pole beans come into bearing later than bush beans, yield more heavily over a longer period and some produce bigger pods. Support must be given the vines, which grow 5 to 8 ft. and more high. Young pods make delicious snap-shorts; also popular as green or dried shell beans. To many persons, pole beans have that good bean flavor that is lacking in some varieties of the bush type.

The seeds should not be planted until all danger of frost is passed and the soil is warm and moderately dry. They do best if the vines are given support, the most frequently used being rough poles, spaced 3 to 4 ft. apart each way. Place 5 or 6 beans around each pole, cover with 2 in. of soil. When plants are well started, thin so that 3 or 4 of the strongest remain to a pole. A packet of seed is enough for 15 poles, except Scarlet Runner, a pkt. of which is enough for 8 poles. Pole Beans may also be planted 3 to 5 in. apart along a trellis or fence.

FAVA BEAN (Bush)

5083 Long Pod 85 days. Much harder than other beans and should be planted as early in the spring as the ground can be worked; they will not thrive in summer heat. Plants are large and erect, true bush form, and heavy yielders. Pods are glossy green, 7 in. long, and contain 5 to 7 large oblong-shaped, flat, light green beans, which are valuable for use as green shell beans. Pods are not edible; the large beans somewhat resemble lima beans and should be used in the same way, either cooked fresh or as a winter shell bean. Flavor is somewhat like that of the pea. A pkt. will plant 15 ft. of row; 1 lb. 75 ft.

How to Grow Pole Lima Beans

Pole Lima Beans mature somewhat later than bush limas and must be given support on which the vines may climb. The yield per sq. ft. of garden space is larger than that for bush limas. Many persons prefer the flavor of pole lima beans to the bush varieties.

Pole Lima Beans are easily grown in any rich, well-drained garden soil. Should be given support, the most frequently used being rough poles, spaced 3 to 4 ft. apart each way. Sow seeds when soil has become warm; put 6 to 8 seeds (preferably with the eyes down) around each pole, cover with 2 in. of fine soil, and firm to assist germination. When plants are well started, thin so that 3 or 4 of the strongest remain to a pole. A pkt. will plant 10 poles; 1 lb. for 50 poles. Small plantings may be made along a fence or trellis, putting several beans 1 ft. apart, later thinning to one strong plant; such plantings would require 1 lb. of seed to about 50 ft. of row; a pkt. will plant about 10 ft. Pole Beans may be planted the same way.

*Burpee's Fordhook,
the most popular
Bush Lima Bean*

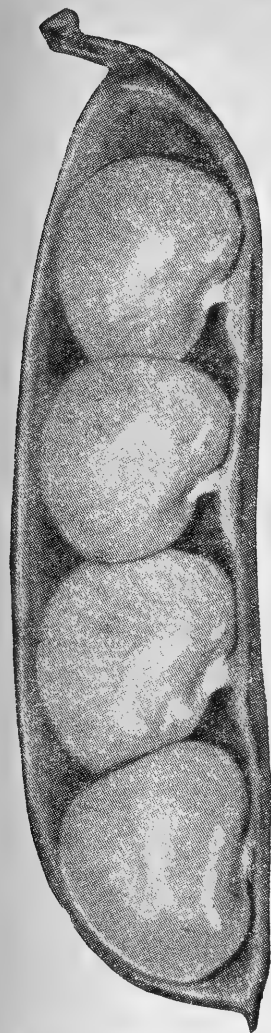

How to Grow Bush Lima Beans

Easier grown than pole limas as plants do not need support. There are varied sizes and shapes of beans to meet your preference, whether it be the large thick (Burpee's Fordhook) or small thick "potato" type (Baby Fordhook), the large flat (Burpee's Improved) or the small flat baby butter lima (Henderson Bush). Some prefer one type for eating fresh, another as dry beans or freezing. We list the best varieties for the purpose.

Bush Lima Beans succeed well in almost any good garden soil but do best in a rich, well-drained, sandy loam. As seed is sensitive to cold and wet ground, it must not be planted until the soil has become quite warm and fairly dry. Plant the seeds edgewise, eye down, 4 in. apart in rows 2½ to 3 ft. apart, and cover with 2 in. of fine soil. When the plants are well started, thin to stand 12 in. apart for large-seeded varieties and 8 to 12 in. for small-seeded varieties. Give frequent and shallow cultivation until blossoms appear, but do not cultivate or handle plants when they are wet. A pkt. of large-seeded varieties will sow 15 ft. of row; one lb. 100 ft.; the small-seeded kinds will, of course, go much farther.

THE EFFECT OF SEASON, LOCALITY, ETC.

Throughout the vegetable section of this catalog, we have given the approximate maturity dates and other comparative information about varieties, such as their size, shape, etc. It should be understood that weather conditions, climate, soil, locality and time of sowing may affect any or all of these characteristics. The approximate maturity dates given will show the relative time when different varieties may be expected to be ready to use.

BROCCOLI Italian Green Sprouting

Most easily grown and delicious flavored vegetable for home, market and freezing. Seeds sown in early spring outdoors will furnish heads in summer while sowings made in midsummer will provide for a late summer and fall crop. For the earliest crop, sow the seeds early in hotbed or house. A pkt. will produce about 125 plants; an oz. 3000.

CHICORY — *Delicious, appetizing salad*

5217 Witloof (French Endive) 110 days. Choice salad delicacy of mildly acrid flavor for use in the fall; if wanted during the winter the roots may be dug and stored upright in boxes and covered with 10 in. of sand, light soil or peat moss. Water and keep in a warm place indoors. In about a month, the sprouts should break through the surface and be ready for use as a tasty green.

ASPARAGUS — *For home, market, canning and freezing*

5009 Mary Washington Shoots are thick, heavy, and straight; dark green, slightly tinged purple at the tightly folded tips. Uniform, heavy yielder and fine flavor; highly resistant to asparagus rust. A light cutting of stalks in three years and regular cuttings each year thereafter may be had from plants raised from seed sown this spring. For quicker results, plant our large 1-year-old roots offered on page 122.

Pkt. 20¢; oz. 50¢; ¼ lb. \$1.30; ½ lb. \$2.40

BRUSSELS SPROUTS — *Delicious flavor*

6006 Long Island Improved 90 days from the time plants are set in the garden. Compact plants, 20 in. tall, with round, dark green, tightly folded, cabbage-like heads measuring 1¼ to 1½ in. in diameter with a more delicate flavor than cabbage. The "sprouts" appear along the central stalk at the joints of the leaves and appear first at the bottom of the plant. Therefore, the lowest sprouts on the plant should be picked each time, after which break off the leaves below the sprout to make further picking easier but do not remove the top leaves. Popular in home gardens. Suitable for freezing.

In the South, seeds may be sown in the spring; elsewhere, sow seed thinly in a specially prepared seedbed or coldframe before midsummer, allowing plenty of time for sprouts to mature before hard frosts; light frosts seem to improve the flavor. A pkt. will produce about 250 plants; an oz. 3000.

Pkt. 20¢; ½ oz. 50¢; oz. 90¢; ¼ lb. \$2.50

COLLARDS — *One of the best boiling "greens"*

5215 Georgia 80 days. Erect, spreading 2 to 3 ft. plants with large, juicy green leaves which provide delicious boiling "greens" of fine quality throughout the entire season. Will stand light freezing which improves the mild cabbage-like flavor of the leaves. Sow seeds outdoors in the spring when soil and weather have become thoroughly warm.

Pkt. 15¢; oz. 35¢; ¼ lb. \$1.00

CHINESE or CELERY CABBAGE

Not a true cabbage; resembles Cos Lettuce somewhat. May be served like lettuce, or, when shredded, makes a delicious cole slaw. Boiled, it is far more palatable than ordinary cabbage. Adapted to quick freezing. Where summers are cool, seed may be sown in early spring, otherwise sowings should be made about 3 months before your first expected frost. If sown too early, plants will "bolt" during hot weather and not form heads. Packet will sow 25 ft. of row, an oz. 200 ft.

5236 Michihli 70 days. A week earlier than Pe-Tsai, sure header and remains in good condition for a long time. Heads grow 18 in. tall, 3½ to 4 in. thick, dark green leaves, blanching pure white inside. Tender, crisp and sweet with an agreeably spicy flavor. CORN SALAD — *Perhaps better known as Lamb's Lettuce*

5219 Large Leaved Round 60 days. Quick grower; fine for early spring, late fall or winter use. It is quite hardy, producing an abundance of gray-green rounded leaves which are sometimes served like lettuce but are better if mixed with more piquant "greens." May also be cooked like spinach or used for garnishing like parsley. Sow seeds outdoors in the spring when soil and weather have become thoroughly warm for early use and again in midsummer for use during the fall.

Roots are slightly larger than the short top strain. For home garden, market, shipping, freezing and canning.

Pkt. 15¢; oz. 45¢; ¼ lb. 95¢; ½ lb. \$1.65; lb. \$2.80

How to Grow Beets

Beets are easily grown and are delicious as baby beets when roots are half grown, or they may be used from then on until they reach their full size. Tops are highly palatable when cooked as "greens" or young beets with their tops may be cooked together. Burpee's Red Ball, Burpee's Redhart, Detroit Dark Red and Crosby's Egyptian are favorites.

Sow seeds as early in the spring as the ground can be worked. For a continuous supply make additional sowings when the preceding planting is up and growing; allow plenty of time for the last sowing to mature before frost. Space rows 1½ to 2 ft. apart and cover seed with ½ in. of fine soil. A rich, sandy loam, mellow and deep, produces the best shaped and smoothest roots. Thin plants to stand 2 to 3 in. apart in the row. A pkt. of seed will sow 25 ft. of row; one oz. 100 ft.

6186 Burpee Redhart® Beet

Pkt. 15¢; oz. 40¢; ¼ lb. 90¢; ½ lb. \$1.70

How to Grow Swiss Chard

Sow seed any time from early spring until midsummer in rows 18 to 30 in. apart; cover with ½ in. of soil. When seedlings are 3 to 4 in. high, thin 8 to 10 in. apart in the row. The plants are quite hardy and will yield throughout the summer and fall until frost. All chards are suitable for freezing. They yield heavily wherever beets can be grown. A pkt. will sow 25 ft. of row; an oz. 100 ft.

Leaves are cooked and served like spinach and the mid-ribs like asparagus, or both may be cooked together. Leaf-stalks make delicious fritters. Cutting may be done by removing outer leaves of various plants, thus allowing the center and remaining leaves to grow, or entire plants may be cut off a couple inches above the crown and new leaves will be produced.

72 days. An outstanding strain notable for its uniformity which, when combined with earliness, makes it most valuable to both home and market gardeners. Well-rounded, solid heads of excellent quality, $6\frac{1}{2}$ in. in diameter and 6 in. deep, weighing from 4 to $4\frac{1}{2}$ lbs. FALL AND WINTER CABBAGE

Burpee's Surehead Cabbage.

How to Grow Cabbage

Cabbage is easily grown and may be eaten raw as cole slaw or cooked in different ways. While the smooth leaved varieties are the most popular, some prefer the green savoy crumpled leaved (Perfection Drumhead); others, the deep purplish-red (Mammoth Red Rock); some, the round heads (Copenhagen Market); others, the pointed (Early Jersey Wakefield) or flat (Premium Flat Dutch). We have the best kinds to meet your choice. Some of the midseason and late varieties make excellent kraut; all the late varieties are desirable for fall use and winter storing.

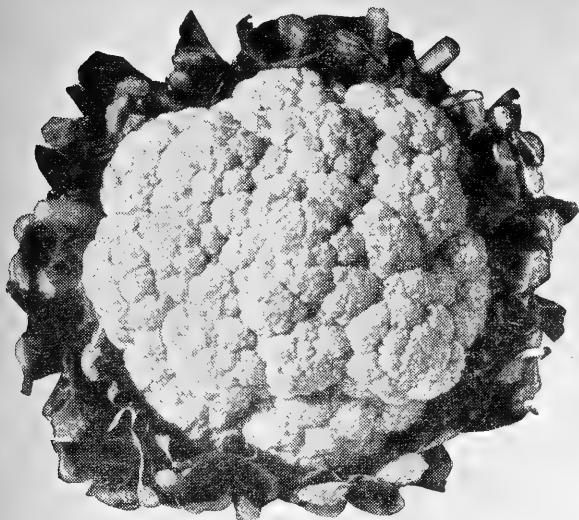

For earliest crop, sow early and midseason cabbage seed in hotbed or house; for medium early cabbage, seed may be sown in a coldframe or open-ground seed-bed in early spring. Sow late cabbage for winter use in a seed-bed outdoors when soil has become warm. A pkt. of cabbage seed will produce about 125 plants; oz. about 3000 plants. Days to maturity are from the time the plants are set in the garden; allow 30 days to produce plants from seed.

Cabbage does best in deep, rich, loamy soil and should be given plenty of water during prolonged dry spells. Space early cabbage plants 18 in. apart in rows 2½ ft. apart; the large midseason and late varieties 2 ft. apart in rows 2½ to 3 ft. apart. Cabbage should never be planted in the same location where it, cauliflower, broccoli, or any of the cabbage family, had been planted the previous year. Healthy, solid heads of late cabbage may be stored for winter use.

CAULIFLOWER

Burpeeana Cauliflower

How to Grow Cauliflower

For a main or fall crop, sow the seed thinly in a specially prepared seed bed or coldframe about 4 months before your first expected frost. Thin out from time to time to allow ample room for development. It is important that cauliflower seedlings are not allowed to become crowded in the plant bed. When plants are ready to be set in the garden, space them $1\frac{1}{2}$ to 2 ft. apart, in rows $2\frac{1}{2}$ to 3 ft. apart. They must always be kept in a healthy growing condition until heads are formed. Any stunting of growth, due to lack of moisture or low fertility, may prove harmful to the crop. A packet will produce about 150 plants; 1 oz. 4000.

How to Grow Celery

For the earliest crop, start the seed in a hotbed or in the house, allowing 10 to 14 weeks to produce plants large enough to set out when weather gets warm. For the fall or main crop, sow seed in the open ground as early in the spring as the soil can be worked into good condition. Cover seed with no more than $\frac{1}{4}$ in. of fine soil. Celery requires a rich, well-manured soil and plenty of moisture for best results. Soil, boards, or celery paper may be used to blanch the stalks. A pkt. of seed will produce about 400 strong plants; 1 oz. about 7500 plants. Days to maturity are from the time plants are set out.

How to Grow Cantaloupes

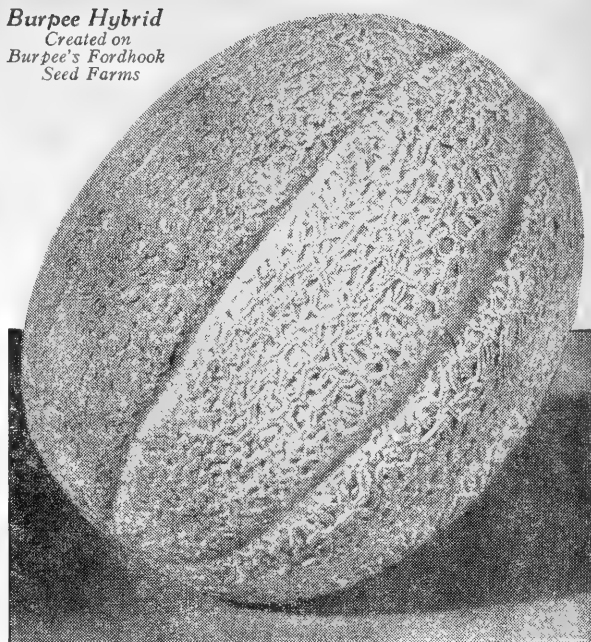

To really enjoy a cantaloupe, fruits should be allowed to fully ripen on the vine for, with the exception of Honey Dew, they do not become sweeter in flavor after being picked. Fruits are ripe when the stem, attached to the melon, will slip from it with a slight touch of the thumb. If the stem does not slip off easily, the melon is not ripe and should remain on the vine. Many persons can select ripe melons by their aroma.

The most suitable soil is a rich, warm, sandy loam. Sow the seed after the ground has warmed up, putting 8 to 10 seeds in groups, allowing 2 to 3 in. between the seeds and cover with 1 in. of fine soil. The groups should be spaced 4 to 6 ft. apart each way. Thin to 2 or 3 plants to a group after the plants are well established. Well-rotted manure dug into the soil where seeds are to be planted and side dressings of commercial fertilizer after the plants have begun to grow are usually beneficial. A pkt. will plant 12 groups, 1 oz. 50 groups or so-called "hills."

How to Grow Carrots

Carrots may be used at different stages of growth but are at their best if eaten when half grown or smaller. There are many ways to use carrots—cook alone, use in soups, stews, chowders, with other vegetables or with roasts; glazed carrots with green peas are ever popular. Raw carrots may be served as a relish when chilled and cut lengthwise in strips; splendid when shredded and used in salads.

Sow seed thinly in early spring in rows not less than 12 in. apart and make additional sowings when the preceding planting is up and growing; allow plenty of time for the last sowing to mature before frost. Cover the seed with ½ in. of fine soil. Thin the small early varieties to stand 2 in. apart in the row and the larger, later varieties from 2 to 3 in. If too crowded, plants will grow slowly so that small, misshapen roots and unsatisfactory yields may be produced. Do the thinning while plants are still small so as to disturb the roots of remaining seedlings as little as possible and be sure to firm the soil back around the plants left in the row. A rich, mellow, deeply worked soil gives the finest carrots. The later sowings will produce nice, tender carrots in the fall. A pkt. will sow about 30 ft. of row; an oz. about 200 ft.

Pkt. 15¢; ½ oz. 60¢; oz. \$1.05

How to Grow Eggplant

May be cooked in various ways. The fruits are at their best edible stage when the skin has attained a high gloss. Use when young, at which time the seeds will be small and hardly noticeable. Keep fruits picked off as they become ready and plants should bear until frost.

A rich, sandy, warm soil produces the best plants and yields the highest number of fruits. Seed should be started in a hotbed, or indoors in shallow boxes or seed-pans, 8 to 9 weeks before the time to set the plants out in the garden. When seedlings are about 3 in. high, plant singly into small pots, setting the plants in the open when all danger of frost is past and the soil has become thoroughly warm. A pkt. of seed will produce about 60 plants; 1 oz. 2000 plants. Days mentioned in descriptions represent average time required from setting plants in the garden until the first fruits are ready.

DANDELION

5226 Thick Leaved 95 days. The large, broad, dark green thick leaves are used as cultivated "greens" for boiling or the leaves may be tied together and the hearts bleached and eaten like endive. In good soil, plants form a rosette 1 ½ ft. and more across.

Pkt. 20¢; ½ oz. \$1.00; oz. \$1.85

Pkt. 15¢; oz. 40¢; ¼ lb. 95¢; ½ lb. \$1.65

6036 Deep Heart © 90 days. All-America Silver Medal Winner. Improved Full Heart Batavian Escarolle of upright growth with a deeper, fuller and more compact heart which readily blanches itself to creamy yellow. Large, thick, dark green leaves with curled edges.

Pkt. 20¢; oz. 45¢; ¼ lb. \$1.25; ½ lb. \$2.15

How to Grow Endive

For early use, sow seed in the open ground as soon as it can be worked; for main crop, make two more sowings about a month apart. In early stages of growth, leaves may have a pungent taste but later the inner leaves blanch and become sweet and tender. Used principally as a salad, but may be cooked and served with butter sauce or grated cheese. A pkt. will sow about 20 ft. of row; 1 oz. 100 ft.

To enjoy Sweet Corn at its best, it should be eaten as soon as possible after ears are pulled. Take husks off promptly and if necessary to keep corn for a short time, put the husked ears in transparent bags and keep at a 40 to 50° temperature until ready to use. Whether you grow yellow or white grained corn is a matter of preference. It is not advisable to save seed from plantings of any hybrids because there will be a reduction in yield the next year. For best results, be sure to get new seed each year.

6023 Burpee Hybrid —First generation (F₁)

Created on Burpee's Fordhook Seed Farms.

CUCUMBERS

60 days. High resistance to mosaic and downy mildew are the outstanding attributes of this true, first generation (F₁) hybrid, white spine, slicing type cucumber. In addition, the yielding ability of the hybrid has been greatly increased over the open pollinated varieties. Vines are extremely vigorous, long lived and bear an abundance of well formed, straight, dark green fruits of handsome appearance, 8 in. and more long, 2½ in. wide, square at both ends with medium seed cavity and crispy, white flesh of quality.

Burpee Hybrid is a high-class cucumber for the home garden, market grower, long distance shipper and greenhouse culture. Burpee Hybrid Cucumber is one variety that should be planted early—as soon as possible after the soil is thoroughly warm. And, don't think you have to give up growing cucumbers if your garden is very small. Cucumbers are natural climbers and may be grown on a fence or trellis. You will be surprised at the number of uniform fruits the Burpee Hybrid will produce.

Getting the Most from a Cucumber Planting

May be harvested at almost any age depending on what purpose the fruits are intended. Different sizes may be picked at the same time, small ones for sweet pickles, larger ones for bread and butter pickles, slicing or dill pickles. Many gardeners prefer to plant the larger fruited varieties for table use and the so-called pickling types and gherkins for relishes or pickles. If you have had poor success with cucumbers, plant Burpee Hybrid listed on the preceding page. Letters from customers all over the country acclaim it as outstanding for yield, quality, color and disease resistance; many tell us we are too modest in our description. It is truly a top-notch.

Cucumbers, sliced unpeeled, make for a more attractive salad and it has been said that if you eat them with the skin on, you may not be troubled with that after-taste which some persons experience.

It is a favorite white spine cucumber for home or market; good producer, ideal shipper and of the highest quality. Valuable white spine cucumber with a very descriptive name.

How to Grow Cucumbers

Make your first sowing of cucumbers after all danger of frost has passed to supply fruits for summer use, and a second sowing 4 or 5 weeks later to furnish cucumbers for fall use and pickling. They succeed best in a fertile, light, well-drained soil. Well-rotted manure or organic matter dug into the soil where seeds are to be planted and side-dressings of commercial fertilizer after the plants have begun to grow are beneficial.

Plant in groups 4 to 5 ft. apart, placing 8 to 10 seeds in each group, and cover with $\frac{1}{2}$ in. of soil. When plants are 6 to 8 in. high, thin to 3 or 4 plants to a group. A pkt. of seed will plant 15 groups; 1 oz. 50 groups or so-called "hills." Seeds may also be sown in rows 4 to 5 ft. apart, 4 to 6 in. apart in the row; later thin the plants to stand 12 in. apart in the row.

Explanation of White Spine and Black Spine

Cucumbers are divided into two families, "White Spine" and "Black Spine." The spines are the miniature stickers that protrude from the warts when fruits are young. White spine cucumbers turn to a creamy white when old; black spine varieties turn to a yellowish orange when matured. Pickling cucumbers, offered below and Burpee Pickler, page 85, are black spined as is Improved Long Green; all others are white spined.

Lettuce grows best during the cool seasons of the year, and in a rich, moist, cool soil, so that the seed should be sown thinly in the spring as soon as the soil can be worked, in rows 1½ ft. apart; cover with ½ in. of fine soil. Several successive sowings may follow about two weeks apart, then discontinue sowings until late summer when they may be made to provide lettuce during the fall. Thin seedlings to stand 1 ft. apart. How to Grow Onions from Seed

For flavoring salads, raw or cooked vegetables, soups, sauces, stews, etc., or served as a separate vegetable, onions are universally popular. A large selection of varieties from which to choose—round or flat in shape, mild or fairly strong in flavor, and white, yellow or red colored skin although the flesh of all is white.

Sow seed as early in the spring as the ground can be worked, in rows 1 to 1½ ft. apart. Cover the seed lightly. The soil best suited to grow onions is one that is reasonably fertile, well-drained, and well prepared. You may pull green onions as needed before the bulb enlarges or large onions after bulbs are formed. If fully matured onions are wanted, thin the seedlings when 3 to 4 in. tall, to stand sufficiently far apart to develop without touching one another. When the bulbs have reached maturity, bend down the tops to hasten ripening before the onions are harvested. Store in a dry, free-from-frost place over winter. A pkt. of seed will sow about 20 ft. of row; 1 oz. 200 ft. See page 122 for How to Grow Onions from Sets; we offer both the white and yellow.

Wrinkled-seeded peas, both early and main crop varieties, are favored by many for home and market growing, quick freezing and canning, because of their extra sweetness and better quality. Contrary to popular belief, they can be planted as early as smooth-seeded varieties—as soon as soil can be prepared, but do not sow in cold, wet ground. They grow best when weather is cool. Burpeeana Early is strongly recommended for its yield and flavor; Burpee's Blue Bantam and Thos. Laxton for larger peas. For main crop, Fordhook Wonder is highly prized for home and market.

EDIBLE-PODDED or SUGAR PEAS

THE PODS ARE COOKED AND EATEN LIKE SNAP BEANS

Sugar Peas possess the tenderness and fleshy podded qualities of a snap bean and the flavor and sweetness of fresh green peas. When young the pods are cooked like snap beans; the peas are not shelled. At this stage, pods are stringless, brittle, succulent and free of fiber or parchment. Should pods develop too fast for use as snap beans, seeds may be eaten as shelled peas and are of the best flavor before they have reached full size. Mammoth Melting Sugar Pea vines should be given support of string or brush to climb upon for best results.

5184 Mammoth Melting Sugar ☉ 75 days. Well-known, productive and resistant to fusarium wilt. The fleshy, tender, 4 to 4½ in. pods are light green, sometimes twisted, broad and blunt-ended, stringless, sweet and delicious. Pods are often sliced for cooking. The dried seed is large and white. Most widely used variety for home gardens; grown for market in some sections. Vines grow 4 to 4½ ft. tall and produce a heavy crop.

Pkt. 20¢; ½ lb. 45¢; 1 lb. 80¢; 2 lbs. \$1.40; 5 lbs. \$3.25

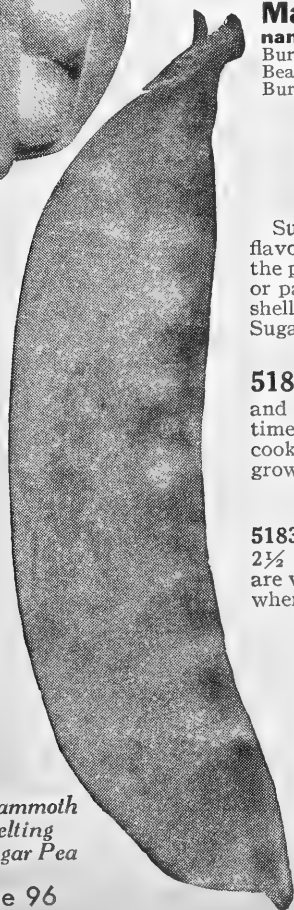

5183 Dwarf Gray Sugar 65 days. The earliest and dwarfest growing sugar pea. Pods 2½ to 3 in. long, light green, curved, sweet and tender. Vines grow 2 to 2½ ft. tall and are very prolific. Because of its dwarf habit, Gray Sugar is ideal for home gardens, especially where space is limited and seasons are short. Dried seed is small and mottled reddish gray.

Pkt. 15¢; ½ lb. 40¢; 1 lb. 70¢; 2 lbs. \$1.30; 5 lbs. \$3.00

How to Grow Peas

Peas make their best growth during cool weather so that the first planting of seed should be made as early in the spring as the soil can be worked. Sow an early variety two or three times at 10-day intervals or choose from the smooth-seeded early, wrinkled-seeded early and main-crop varieties. Sow again in late summer for a fall crop. Planting space available more or less governs the number of sowings and the choice between tall and dwarf varieties. Peas are usually planted in double rows 3 in. apart, the seeds dropped 2 in. apart and covered with 1 to 2 in. of soil. Double rows should be spaced about 2½ ft. apart. For best results, provide supports (wire, brush or string) for the tall-growing varieties to climb upon. A pkt. will sow 20 ft. of single row; 1 lb. 100 ft.

"—My Burpee Hybrid cantaloupes averaged over 6 lbs. each; I had some that weighed 10 lbs. One single plant produced 8 melons with total weight over 50 lbs. Quality is outstanding. Vines very vigorous and healthy. . . ."

Burpee Hybrid Cantaloupe

Burpee Hybrid Cantaloupe is a true, first generation (F_1), outstanding for quality and flavor. Fruits are heavily netted, ribbed round to slightly oval, 7 in. long, 6 in. across and weigh 4 to 4 1/2 lbs. each. The sizes we give are average; we, too, have grown much bigger melons. Regardless of their size, quality is unsurpassed. How to Grow Peppers

Sow seed in a hotbed or indoors in shallow boxes, pots or seed-pans of rich soil; cover seed with ¼ in. of fine soil. Allow 8 to 10 weeks to produce plants large enough to set outdoors when all danger of frost is passed. When the soil has become warm, set the young plants in the garden, 18 to 24 in. apart in rows 2 to 3 ft. apart. A pkt. will produce about 50 plants; 1 oz. 1500. Days mentioned in descriptions represent the average time required from the setting of the plants in the garden until the first fruits are ready for table use.

Peppers are classed in two groups, the sweet or mild and the hot. The sweet fleshed peppers are desirable for slicing, salad and stuffing; they come in different forms—some blocky (Burpee's Fordhook), some heart-shaped (Burpee's Early Pimento), and another like a tomato in shape with a very mild flavor (Burpee's Sunnybrook). All are green at first changing to red when ripe, except Oshkosh, which turns to bright yellow. Hot fleshed peppers vary in shape from those resembling a cherry to the extremely hot little tabascos and the long red cayenne. They are red when ripe. Fine for sauces, flavoring and pickling either fresh or dried.

SUMMER SQUASH

*Burpee Hybrid
Zucchini*

In descriptions, we give the average size of fruits when fully grown. For the best eating, summer squashes are used when immature, usually when very small. Bush varieties take up little room and are especially adaptable for the small garden; cocozelle and zucchini are very popular bush types.

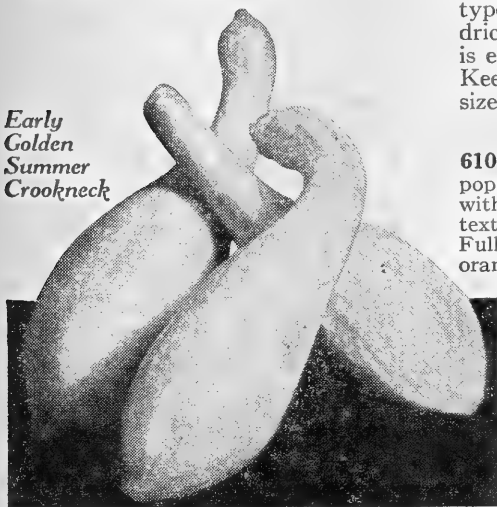

Fall and winter squashes produce hard-shelled fruits which may be stored for use during the winter. Valuable for baking, boiling, making pies, etc. Unlike summer squashes, fruits of the fall and winter varieties must remain on the vine until fully matured; gather them before frost, leaving part of the stem attached to the fruit. Handle carefully and avoid bruising. They may be easily stored in any dry, cool place.

How to Grow Squash

Summer Squash. Sow seed after danger of frost has passed. Put 5 seeds in groups, allowing 2 to 3 in. between the seeds and spacing the groups of bush varieties 4 ft. apart each way and those of the running kinds either 8 by 8 ft. or 10 by 12 ft. apart. Thin bush varieties so that 3 or 4 of the strongest plants remain in a group; running varieties allow 2 or 3 plants to a group. Pkt. will plant 8 to 10 groups; an oz. 30 to 40 groups. They may, like pumpkins, be planted among the corn.

Winter Squash. Sow seed in the same way as given above for the running varieties of summer squash; 4 seeds in a group is sufficient. A pkt. will plant 6 to 8 groups; 1 oz. 20 to 30 groups. All varieties of squash grow best in a fertile, deep soil.

How to Grow Spinach

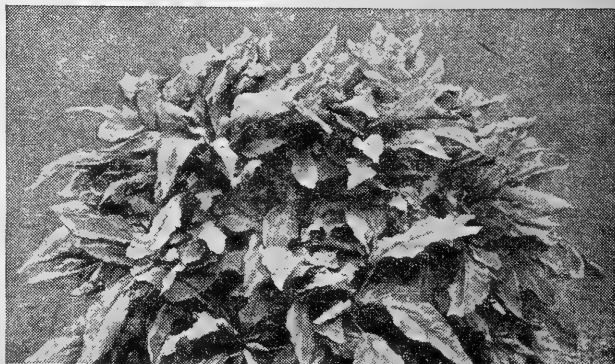

Sow seeds very early in the spring, either broadcast or in rows 18 to 24 in. apart; cover the seed with 1 in. of soil and thin plants to stand 5 or 6 in. apart in the rows. At each picking, remove every other plant, which will allow room for remaining plants to fully develop. Additional sowings may be made when the preceding planting is up and growing, but the last should be two months before hot weather is expected. For fall use, sow in late summer; for early spring use, where winters are mild, sow in early fall and cover with a few inches of hay, leaves or litter. A pkt. will sow 25 ft. of row; 1 oz. 75 ft. Directions for growing New Zealand spinach are given on the seed bags.

FORDHOOK SPINACH OR TAMPALA

5341 Burpee Fordhook Spinach

Within 6 to 8 weeks from sowing, Fordhook Spinach is ready to use when the entire plants make the most delicious "greens" either raw as a salad or cooked like spinach. As a cooked, canned or quickly frozen green, Fordhook Spinach is, in the opinion of many, superior to regular spinach or Swiss Chard—more appetizing color, more delicious flavor, shrinks very little, holds its dark green color better and is easier to prepare. The young leaves are so tender they require only a few minutes to cook; stems may be cooked like asparagus, their flavor being suggestive of artichokes. This newly recognized green leafy vegetable has an unusually long period of usefulness in the summer garden, doing best when days are long. Seed of Fordhook Spinach, then, should not be sown until soil and weather have become warm.

Sizes and Weights of Tomatoes

given in our descriptions are for the general field-run of fruits. Customers often write us that they have produced tomatoes bigger than we state they will grow. This is not surprising for with special care, proper fertilizing, watering, pruning, staking, etc., they may easily do better than we claim. This might readily apply to other vegetables, as well as tomatoes.

Important—Please Read HYBRID TOMATOES

Hybrid Tomatoes are strong, vigorous growers and out-yield regular varieties, the extra quantities coming, in large measure, from the soil. It can be readily understood that because Hybrid Tomatoes have the ability to produce larger plants and higher yield they must be fed more than standard tomatoes. Therefore, to produce a maximum crop of large fruits, we recommend that you maintain good fertility and moisture in your soil. For this purpose, it is desirable to make your fertilizer application at the time of planting and, if possible, cover the ground around the plants with well-rotted manure when plants begin to bloom or set their first fruit. Water during dry spells.

Each hybrid tomato seed is produced by hand pollination which requires a great deal of work and entails a heavy expense. We strongly urge that special care and attention be given to the sowing of the seed and the growing of the crop. Extra care will repay you in better fruits and a bigger yield.

How to Grow Tomatoes

Sow seed in a hotbed, or in a shallow box in the house, allowing 6 to 8 weeks to produce plants large enough for setting outdoors when weather becomes warm. Light, friable soil of medium fertility is best for starting the seed. Cover seed with 1/4 in. of fine soil or sand. Keep soil moist but not too wet and avoid excessive drying. If seed is sown in container, keep it in a warm place (65 to 70°). When seedlings are about 2 in. tall, transplant to stand 4 in. apart each way, or pot singly in 3 in. pots. Plant outdoors when all danger of frost is past in rows 3 to 4 ft. apart each way, if to be grown untrained and unpruned; if supported on stakes, plants may be set 18 to 24 in. apart in the row, except hybrids, which should be spaced 2 to 2 1/2 ft. apart. Disturb roots as little as possible when transplanting.

Where summers are long, seed of standard varieties may be sown directly outdoors when soil and weather get warm. A pkt. of standard tomato seeds will produce about 100 plants; 1 oz. 5000 to 6000.

Large Red TOMATOES

Globular, slightly flattened, smooth, bright red, heavy walls and small cells. Most valuable for canning and juice. Vine is vigorous, heavy, and wilt-resistant to a high degree. Small Red Tomatoes

San Marzano

Red Cherry, Yellow Pear and Yellow Plum tomatoes are widely used for preserves; chilled and served whole in the fresh state as appetizers or in salads.

Red Cherry Tomatoes

6132 San Marzano 80 days. Highly productive and extensively grown for canning whole, for puree and making "tomato paste." Fruits are rectangular-shaped, 3 1/2 in. long and 1 1/2 in. across, non-cracking, flat sided, borne in clusters and with the most intense red of all commercial tomatoes. Exceptionally meaty, free from juicy pulp and of very mild flavor. Ripe fruits are long-lasting on the vine or in storage. They are fine if peeled whole for salads.

Pkt. 45¢; 1/2 oz. 95¢; oz. \$1.50

5333 Red Cherry 72 days. Small, round-fruited, scarlet tomatoes 3/8 in. across are freely borne in large clusters throughout the summer. Gets its name from the shape and size of the fruits which are used for preserving, pickling and salads, or eaten whole.

Pkt. 25¢; 1/2 oz. 65¢; oz. \$1.15

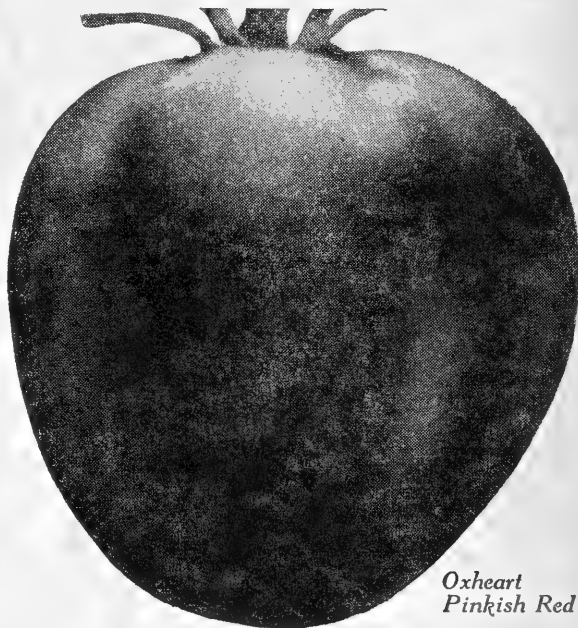

Large Pink TOMATOES

For years it has been customary to refer to the following varieties as pink fruited; the only difference between a red tomato and a pink tomato is the skin color. Red tomatoes have a yellowish skin while the pink has a transparent skin. They are usually milder and more delicate in flavor than red fruited tomatoes; meat is fleshy, with few seeds.

5323 Burpee's Globe —Extra choice

80 days. All-America Silver Medal Winner. Uniform, medium to large, rich pinkish red, globe-shaped, smooth tomatoes in clusters of 6 to 10, interior is firm, meaty, and free from any core. Contains little or no acid; a shy seeder, the seed cavities being full of solid meat. Excellent for home and market where a main-crop pink tomato of solidity and quality with high yielding ability is desired. Adapted to pruning, staking and forcing.

Pkt. 25¢; 1/2 oz. 75¢; oz. \$1.35; 1/4 lb. \$3.85

Oxheart Pinkish Red

5324 Oxheart—Extra large, deep fruits

86 days. One of the largest pink tomatoes ever introduced; often weigh 1 lb. and more. The oxheart shape of the pinkish red fruits is most distinct; interior is extremely solid with thick, firm walls and small cavities with few seeds. Oxheart is noted for its delicious and appealing flavor.

Pkt. 25¢; 1/2 oz. 70¢; oz. \$1.35; 1/4 lb. \$3.85

5334 Ponderosa—Immense fruits

83 days. It is not unusual for the purplish pink, deep, somewhat flattened fruits to weigh 24 ozs. and more, though the average runs around 9 ozs. The seed cavities are remarkably small, which accounts for the solid, luscious flesh of a delightful mild flavor. Of fine quality, tasty and palatable. Essentially a home garden tomato although it finds ready sale on local markets and roadside stands.

Pkt. 25¢; 1/2 oz. 70¢; oz. \$1.35; 1/4 lb. \$3.90

Small Yellow Tomatoes

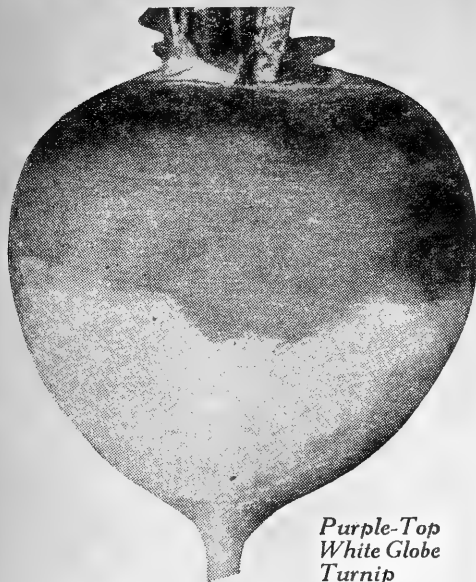

5335 Yellow Pear 70 days. Fruits are yellow, pear-shaped with definite neck; 1 3/4 to 2 in. long, 1 in. in diameter and borne in clusters. Of exceedingly mild and pleasing flavor; sweet and delicious. Fine for salads in the fresh state, or for preserving and pickling.

Pkt. 25¢; 1/2 oz. 70¢; oz. \$1.15

5332 Yellow Plum 70 days. Immensely productive small fleshy tomato, the size and shape of a plum. 2 in. long, 1 1/2 in. across. Bright lemon-yellow skin; fine for preserves or salads. May be served whole and eaten raw. Sweet and of a most delicious flavor.

Pkt. 25¢; 1/2 oz. 70¢; oz. \$1.15

5074 Golden Ball—*Sweetest yellow fleshed turnip*
60 days. Perfectly globe-shaped, bright creamy yellow turnips with appetizing, pale amber-colored flesh. The best yellow-fleshed variety for table use, spring or fall. Also known as **Orange Jelly**. Good quality, fine grained; for home and market.
Pkt. 20¢; oz. 35¢; ¼ lb. 65¢; ½ lb. 95¢; lb. \$1.75

How to Grow Turnips

At their best when growth is made during cool weather. Sow Extra Early Milan in the spring for its roots and the foliage type for its tops which are much used for "greens." Sow any variety in late summer for fall use or storing of the roots for use during the winter—Purple-Top White Globe being the most popular. Frost improves the flavor of foliage turnips.

Sow seed in rows 12 to 15 in. apart. Thin seedlings to stand 2 to 4 in. apart in the row. For succession, make 2 or 3 sowings at two-week intervals. For fall and winter crop, sow in rows or broadcast about 3 months before first expected hard frost. A pkt. will plant 50 ft. of row; an oz. 250 ft.

5076 Foliage or Shogoin Turnip—*Quick grower*

A double purpose turnip. 30 days to use foliage; 70 days for roots. Tops are large, 18 to 20 in. tall, plentiful, tender, and of a mild, delicate flavor; they are ready for use as "greens" in about 30 days and may be used at any time during the growing season. Also produces a white turnip, 3 to 4 in. thick, flattened globe-shaped, white skin and flesh. Tops and roots may be cooked together if you so desire.

Pkt. 15¢; oz. 30¢; ¼ lb. 65¢; ½ lb. 95¢; lb. \$1.75

RUTABAGA

6126 Burpee's Purple-Top Yellow ☉

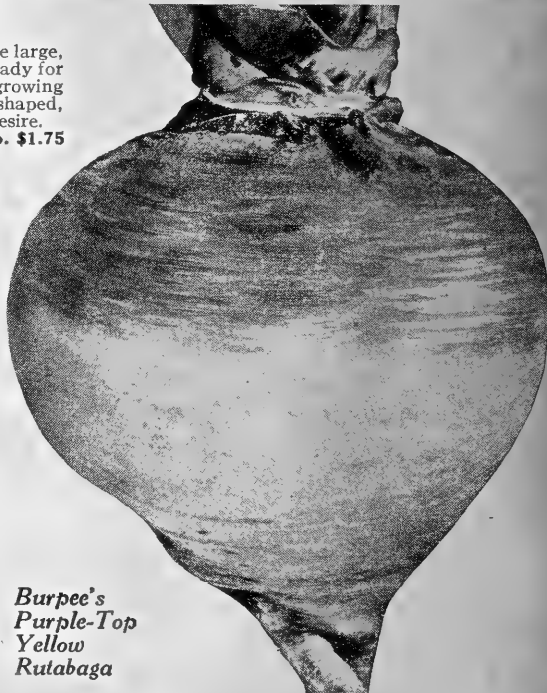

90 days. Large, smooth, globe-shaped roots with deep purplish red coloring in the upper portion above ground, light yellow below. Sweet, fine-grained, yellow flesh cooking to bright orange. Will keep in fine condition until quite late in the spring. The leading rutabaga for table use during fall and winter; it is also valuable and widely used for the feeding of stock.

Pkt. 15¢; oz. 35¢; ¼ lb. 65¢; ½ lb. \$1.05; lb. \$1.60

How to Grow Rutabagas

The flavor of rutabagas is preferred by many to turnips. Housewives often refer to them as "big yellow turnips" or "Canadian turnips," names sometimes used in the produce and shipping trade.

Sow seed from early to late midsummer, in rows 15 to 24 in. apart. Cover with ½ in. of fine soil and thin the seedlings to stand 6 to 8 in. apart in the row. May be stored in a cool cellar or pit and used throughout the winter. Best used as a fall crop. A packet will sow about 50 ft. of row; an oz. 250 ft.

Green Leaf Vegetables for Winter Salads and Cooking

Greens and salads are highly beneficial to health as they are good sources of minerals and are also rich in vitamins. They are easily grown, very palatable, and may be had in a wide range of flavors from the piquant tang of endive to the mild taste of lettuce. Combinations of greens and salads are highly desirable and pleasing.

"Greens" grow best during the cool seasons of the year. In addition to spring plantings, you should plan to sow again in mid- or late summer for fall use or later where winters are not too severe.

Lettuce, the brittle, tender leaves of the crisp and loosehead types; **Endive**, the refreshing flavor of the curled or the tangy taste of the Batavian Escarolle; these are the universal favorites. Then, there is **Chinese Cabbage** with its delicate celery-lettuce flavor, and for many weeks after frost you can use the regular Cabbage. Others include **Broccoli**, with its rich green, sprouting heads; **Brussels Sprouts**, whose flavor seems to improve after a

light frost as does **Kale**; **Chives**, with its mild onion-like flavor; **Bunching Onions** for green scallions; **Leeks**, sweet flavored, thick stems; **Collards**, good boiling green with cabbage-like flavor; **Corn Salad**, well known Lamb's Lettuce; **Mustard Greens**, splendid for salad or cooked like spinach; **Parsley**, a "must" in every garden, for garnishing or dried for use as flavoring; **Spinach**, frosty nights improve the color; **Swiss Chard**, popular for boiling greens as is **Spinach Beet**; **Turnip Greens**, use the Foliage variety, leaves have a mild flavor when cooked like spinach.

Remember, too, to provide for **Beets**, **Carrots**, **Turnips**, **Rutabagas** for winter use; they may be pitted in the garden or stored in a cool cellar. **Parsnips** and **Oyster Plant** may be left in the ground and dug whenever you can get into the soil during the winter or leave them for use in early spring.

Keep your garden working. The excellence of a garden consists not in its size, but in the yield and quality of its produce. See that it is well planned and well cared for. Even a small garden is an important addition to the family income and health.

6068 New Hampshire Midget ☉

5252 Stone Mountain 88 days. Also known as **Dixie Belle**. High quality oval-round watermelon with grayish green smooth skin and beautiful deep crimson flesh without any white or stringiness in the heart. The average melon weighs about 45 lbs. A fine melon for home and market.

Pkt. 15¢; oz. 35¢; $\frac{1}{4}$ lb. 85¢

How to Grow Watermelons

Take your choice of round, oval, or long shaped melons and pink or red flesh. If you live in the North, plant the quickest maturing varieties (New Hampshire Midget, Early Northern Sweet or Sunnybrook Hybrid).

If you have not been able to grow melons, because disease spoiled crops of non-resistant varieties, try Charleston Gray or Dixie Queen.

Plant seed after all danger of frost has passed and the soil has become thoroughly warm. Place 6 to 8 seeds in groups, allowing 2 to 3 in. between the seeds and space the groups 6 to 8 ft. apart each way. Cover seed with $\frac{1}{2}$ in. of fine soil. Thin to 2 or 3 plants in each group after plants are well established. Rich, rather sandy soils produce the finest watermelons, but a well-drained loam is also suitable. A pkt. will plant 6 groups or so-called "hills"; 1 oz. about 30 groups.

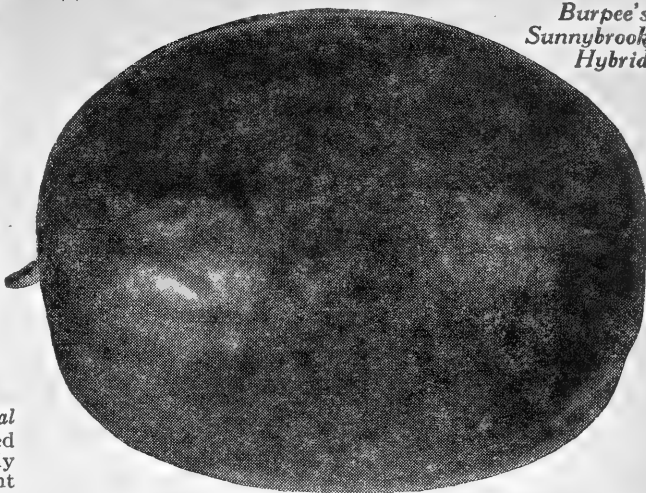

6065 Dixie Queen, Wilt Resistant ☉

90 days. Fruits are similar to original Dixie Queen in color of skin, light green striped dark green; in size, 15 in. long and 12 in. across; in weight, 30 to 35 lbs. and the flesh is just as delicious—deep red when ripe, extremely sweet and free from fiber. Seeds are white but two to three times the size of regular Dixie Queen. Vines are highly resistant to wilt. Thin, tough rind. A dependable producer for home and market gardeners. Good shipper.

Pkt. 20¢; oz. 50¢; $\frac{1}{4}$ lb. \$1.35

Burpee's Hardy Garden Lily Bulbs

Easy to grow in any good, well-drained garden loam to which has been added a generous quantity of leaf mold. Once established, they will increase in beauty each year. Most all lilies delight in a sunny location, but it is advisable to mulch so that the hot sun does not reach the soil around the base of the plant. All varieties offered are highly decorative in the border, while the dwarfer ones also give a charming touch of beauty to the rock garden. Lily bulbs differ greatly in size according to variety—some 1 in. across, others 3 in. or more; we supply the sizes which will give the best results. We do not recommend Hardy Lily bulbs for house culture. How-to-grow directions are sent with the bulbs.

7261 Gloriosa Lily LILY ROTHSCHILDIANA

A most unusual and fascinating garden lily in that it will climb if it has something nearby to which it may attach itself. Leaves are elongated, soft green with curling tendrils on the tips with which they cling to a fence, trellis, string or wire.

Lily Rothschildiana is exotic in color and shape. The petals are sharply recurved, brilliant red bordered golden yellow—a striking bicolor contrast, the red becoming darker as flowers age. Planted in full sun, the colorings are more brilliant but plants become stockier, shorter and the stems of less length. Blooms have remarkable keeping qualities so make wonderful cut flowers. They also make attractive pot plants.

Roots are entirely unlike any of the other lilies—they do not have scales but are somewhat like a small dahlia tuber, 4 to 6 in. long and a trifle thicker than a lead pencil. Plant in a horizontal position, 4 to 5 in. deep in full sun or semi-shade. They do best in a sandy soil, preferably on the acid side; it is essential that any soil in which tubers are planted be well drained. Not hardy except in frost-free sections.

This unique and interesting lily is a species discovered in East Africa. Early records show it was grown on the estate of the Hon. Walter Rothschild of England, for whom it was named. \$1.25 each; 3 for \$3.50; 6 for \$6.50; 12 for \$12.50

Gladiolus Bulbs

Burpee's famous gladiolus are grown and admired wherever beautiful flowers are known. They make attractive displays in the garden, planted either in beds or in groups here and there in perennial or annual borders and are ideal for house decoration. If the spikes are cut when the bottom flower shows color, all the buds, clear to the top, will open. They are easily grown in any good, well-drained soil.

The gladiolus bulbs that we offer are large, 1½ in. and more across and will produce the largest flowers and the tallest spikes. All Burpee bulbs are guaranteed to bloom or your money back. We offer an extra choice selection of named varieties on this and the opposite page.

You may order 25 bulbs or more of the same variety at the 100 rate.

Cultural directions are printed on every bag containing the bulbs.

Burpee's DAHLIA ROOTS

Each year on our Fordhook Farms we try out hundreds of varieties of dahlias and select those that are the best growers, freest bloomers, and which we recommend as the best for you to plant. All are listed here, with some outstanding varieties that we have created. Whether you select the massive Formal or Informal Decorative, the lovely Cactus, Semi-Cactus or the small Pompon varieties, you will be delighted with the results.

F. D. = Formal Decorative; I. D. = Informal Decorative; C = Cactus; S. C. = Semi-Cactus.

Cultural directions are sent with every order for Dahlia roots. We supply **strong root divisions** from field-grown clumps which are guaranteed to produce satisfactory results or your money will be refunded. All roots are sent prepaid anywhere in the U. S.

The American Dahlia Society has adopted a classification for all dahlias according to the formation of the flowers. After each name we use initials to denote the class to which that variety belongs.

The shoots are thick, heavy, and straight; dark green, slightly tinged purple at the tightly folded tips. Uniform, heavy yielder and fine flavor; highly resistant to asparagus rust. Roots should be planted as early in the spring as the ground can be worked, spacing them 15 to 18 in. apart in rows 2½ ft. or more apart. We supply large one-year old roots which are larger than average, carefully graded and packed to give you the best results. RHUBARB ROOTS

The succulent stems of rhubarb are an appetizing dessert, either stewed or in pies. Never use rhubarb leaves for food purposes. Space roots 3 to 4 ft. apart; cover the crown with 3 to 4 in. of soil. Planted in early spring, roots will furnish a moderate cutting of stalks the next spring; regular cuttings thereafter.

In gathering rhubarb stalks, select the larger ones growing on the outside of plant, grasp them firmly near the base and with a slight sideways twist, pull them from the crown. Red-stalked rhubarbs are sweeter and make a sauce that is more beautiful and more delicious than the usual commercial rhubarb. All varieties are prized for canning as well as freezing.

Burpee's Lawn Grass Seed

SHIPPED PREPAID ANYWHERE IN THE U. S.

The best time to start your lawn, or to repair it, is during the cool weather of early spring or in early fall. The weather at these times is favorable for the development of domestic grass but unfavorable for most weeds and wild annual grasses. Why not plan now to have a luxuriant lawn that will add to the beauty of your home?

The Burpee leaflet, "GN 43 Construction and Maintenance of the Lawn," will be sent free upon your request. For new lawns, sow 1 lb. of grass seed to 200 sq. ft. of space; use 100 to 150 lbs. per acre. 1 lb. MERION Kentucky Bluegrass is enough for 500 to 750 sq. ft. To improve old lawns, use half of these quantities.
